# SPEECH RECOGNITION HANDLING WITH SYNTHESIZED
# MANUAL INPUT EVENTS

Abstract of the Disclosure

A voice responsive system controls a device in response to both a

5     manual input and a voice input. The system includes a processor, a memory

system coupled to the processor and processor executable code. The processor

executable code includes an operating system and a voice recognition

application for causing the processor to perform a number of steps. Initially, a

voice message is provided from the operating system to the voice recognition

10     application. Next, an appropriate simulated manual input event is provided

from the voice recognition application to the operating system in response to the

received voice message. Then, an appropriate manual input event message is

provided from the operating system to the voice recognition application in

response to the simulated manual input event. The voice recognition

15     application then initiates control of the device responsive to the manual input

event message.
